

Windich v0.1.0+8

Your very little companion app for your location.

Weather, real-time and forecast

Wind compass

Compass

GitHub

Get Started

It's "windich" (windy).

A smartphone app to display your current location's weather now and with a 3h forecast. It comes with a wind compass and a compass (esp. handy when the GPS tells you to "head southeast" 😉). That's it.

Features

- OS: So far, only Android is supported.
- Weather: Uses OpenWeather API.
- Secure Storage: Stores the API key encrypted on the local device only.
- Languages: The app language follows the device language as per system settings.

  The following languages are supported:

  - 🇺🇸/🇬🇧 (default & fallback)
  - 🇩🇪

  The language cannot be changed in the app itself.
- Themes: Both dark and light themes are supported.

  The app remembers your last selected theme.

Screens

The circled wind compass indicates from where the wind is blowing towards you.

Saving an empty key removes it from the persistent storage.

The app won't work without a key!

Disabling/Enabling device network requires an explicit "Refresh" to take effect.

Key

Windich uses OpenWeather which requires an API key. At this point in time, using the OpenWeather API is only free of charge up until 1000 API calls per day! (So far, when using Windich 24/7 20 refreshes per hour are within the free tier.) Please read

OpenWeather Pricing for details.

Long story short, please sign up and bring your own key. OpenWeather API keys are managed on the account page.

The app won't work without a key!

Permissions

Here's the list of application permissions and for what they are required:

- Internet: Required to make HTTPS calls to OpenWeather APIs.
- Location: Required to provide weather info for the current location.

Upon first start or app reset, Windich will ask for the permissions about location. If you deny any of the permissions, the application will not work as expected. You can always change the permissions in the settings of your device.

On Android, please grant the permissions when asked, one after the other, as follows:

- Allow Windich to access this device's location?: Choose "Precise" and "While using the app"
- Location permission: "Allow all the time"

Please note though, that

- revoking those permissions in retrospect, while the app is running, will cause the weather information update to fail with the next refresh.
- re-adding permissions while Windich is open requires a refresh.

Last, on Android under 'App info' → 'Unused app settings', to avoid unintentional revocation of previously granted permissions, make sure to disable 'Manage app if

unused'.

Privacy

Windich itself does not collect any personal data. The application does not store any data on a server. The user's (OpenWeather API) key is stored securely on the client device. The application itself does not use cookies or any other tracking technologies.

Please note that, through the usage of the API, OpenWeather Terms apply.

Disclaimer

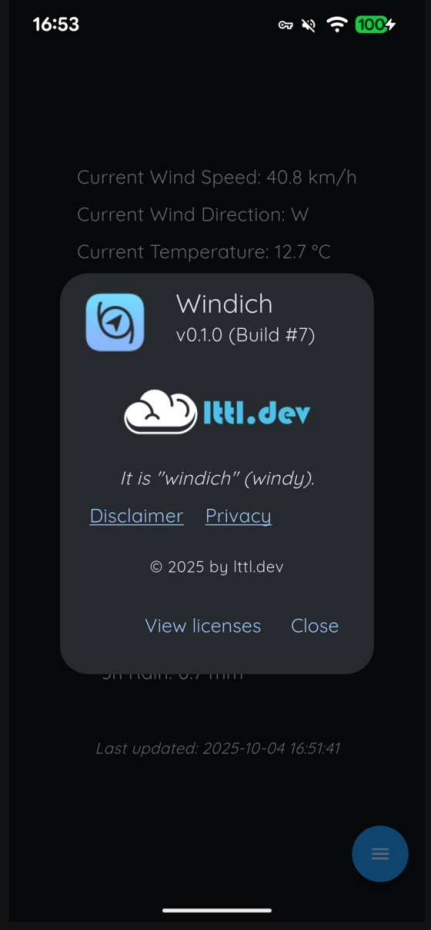

The application is neither commercial nor affiliated with any corporation or organization. It's a pet project which, besides, is not available through an app store. (Here is why.) The app is provided as is and without warranty of any kind. The author is not responsible for any costs, damages or losses that may result from the use of the application or the OpenWeather APIs. By using the application, you agree to this disclaimer.

Please also note that this website includes links to external sites. The author does not control, endorse, or assume responsibility for the information, products, or services offered by third-party websites.

See also here.

Installation

The app needs to be built and sideloaded. Please see the source repo's DEV section for details.
